

Coping With Back Pain

Many individuals have an occasional backache, but when the pain becomes severe or you experience the pain more frequently you should consult a doctor.

POSSIBLE CAUSES OF BACK PAIN:

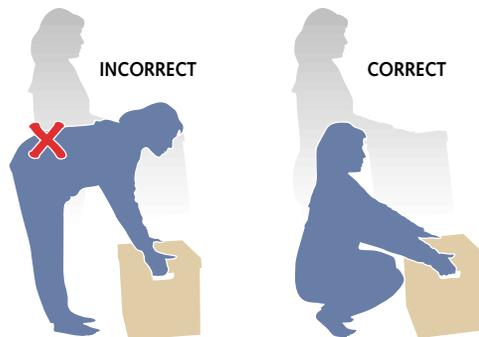

Some common causes of back pain are:

- Stretched or strained muscles in the back
- Injuries (such as from a fall) that cause trauma to muscles, bones, or other tissues in the back
- **Herniated** (or “slipped”) **disks** (this occurs when part of a disk that provides cushioning between 2 vertebrae—the bony structures that make up the backbone or spinal column—bulges out, which can cause pressure on surrounding tissue, such as nerves)
- **Osteoporosis** (decreased density of the bones)—can cause vertebrae to become fractured or compressed
- Being overweight
- Bad posture
- Being pregnant

Back pain can be a symptom of a number of other medical problems. Therefore, your doctor may ask you a number of questions about other symptoms you may be experiencing along with your back pain.

PROTECTING YOUR BACK WHEN LIFTING:

- Lift with leg muscles not back muscles; bend your knees (by squatting down to pick up object) not your waist or back
- Keep back straight (do not bend over) while lifting
- Keep the weight of what you are lifting close to your body
- Do not twist when lifting

An article in the December 6, 2000, issue of *JAMA* discusses the reports on a study of frequent use of a back belt (a belt designed to protect the back from possible injury when lifting) by workers who lift merchandise. The researchers did not find any benefits to using a back belt.

SELF-HELP IDEAS FOR EASING BACK PAIN:

- Short periods of rest lying flat on your back with your knees raised (by a pillow, for example); long periods of bed rest may weaken the muscles, adding to the problem and increasing the time to recover
- Limited rest combined with gentle exercise and lighter than normal activities
- Taking nonprescription pain relievers and/or anti-inflammatory medications following the manufacturer's instructions

Consult your doctor if the above strategies do not work for you. Your doctor may prescribe anti-inflammatory drugs, drugs that relax the muscles, and/or painkillers. Under severe conditions, back pain caused by structural problems with the backbone may require surgery.

PREVENTING BACK PAIN:

- Get regular exercise
- Stretch before exercise and other physical activities
- Do exercises to strengthen and make back muscles more flexible
- Do exercises to strengthen the abdominal muscles
- Always keep a good posture when standing and sitting
- Avoid standing or being in one position for too long a period of time
- Lose weight if you are overweight

WHEN TO SEE A DOCTOR:

If you experience:

- Severe pain that makes it difficult to move
- Fever and/or vomiting with the back pain
- Pain, numbness, or tingling in another part of your body
- Weakness in another part of your body
- Bowel problems or bladder problems, such as losing control of going to the bathroom
- Pain that lasts for more than 3 to 4 days
